

README FILE FOR OUR IC PROJECT

Automatic Quiz system

- Description:
- Our project is a multipurpose project that is made to ease the work of both instructor and students, a one stop project to create a quiz , attempt the quiz exam and even display the result:
- Instructor: Our project allows the instructor to create a quiz either from the predefined database of questions of courses IB(Introduction to Bio-engineering) , IC(Introduction to Computer Science) , IE(Introduction to Electrical Engineering) and Maths-1 or create a custom quiz by inputting the questions along with their answers. It is a convenient way for instructors to conduct quizzes.
- Student: Our project allows the students to attempt the quiz exam created by the instructor and also analyze the result of the quiz given . It will also have the option of displaying the performance of the students who gave the same quiz by displaying the histogram.
- Installation guide
 1. Firstly download all the files provided by us.
 2. Now execute the main file and run the code.
 3. We have not used any external libraries so it will run directly.
- Some modifications as per your system
- For Mac users

Make changes in the timer.c function like
Add
`#include<unistd.h>`
Used `sleep(seconds)` instead of `Sleep(microseconds)`
- For Windows users

Please comment out the `system("cls")` section to get a better terminal view
- Usage

0.The program will initially ask you whether you are instructor or a student and on the basis of that it will proceed further.

(a). Instructor :

1. First the instructor will have to choose if the quiz to be inputted is to be user defined or from the database.
2. If the quiz is to be from database then the program will take input of the number of questions(maximum 25).
3. Then the instructor will select the course whose quiz is to be conducted. And the quiz will be created.
4. If the quiz is to be inputted by the user then it will ask first for course code of the course whose quiz is to be conducted
5. After that the instructor will input the number of questions to be answered in the quiz.
6. After that the user will input the questions(MCQS only) each ending with a \$ sign(important) and the answer to the input question which shall only be in lower case alphabets-a,b,c,d.
7. Now the instructor will input the number of students who will be taking the quiz.

(b). Student:

1. If the user inputs to be student then it will first check if the quiz has been created or not.
2. Then the program will start displaying the questions one at a time and the user will have to input the answer to the displayed question.
3. Now the responses will be saved and analysed on the basis of answer key and a histogram will be displayed displaying the performances of all the students who took the quiz.

- Features of our project

1. Our project can create quiz from both the already defined databases of questions or can be manually input along with the answers.
2. The project allows multiple students to take the same quiz on the same system thus saving the responses as well.
3. Since multiple students are giving the same quiz based on their scores the performances will be analysed and a histogram will be displayed accordingly.
